

Consent to Participate in a Research Study

Version 4, August 25, 2022
NCT04262206

Concise Summary

This is a research study to find out if a drug called atorvastatin can help older adults live well for longer by preventing dementia, disability, or heart disease.

Participation in the study may last up to five years. You will be assigned by chance to receive either atorvastatin (study drug) or a matching placebo (a tablet that looks like atorvastatin but does not contain any medicine). At your first visit, the study team will also ask a few questions, draw blood, and perform memory and physical tests. You may be asked to come back for another blood draw visit at three months as well. For most of the study, the study team will call you on a yearly basis to see how you are doing. If the study team needs to follow-up on your memory or physical ability, you may have an in-person visit at your home or in clinic. In addition, the study team will get information about your health through your medical records, Medicare and the National Death Index. There are some benefits and risks from participating in this study. Possible risks include side-effects such as nausea or muscle pain, from taking the study drug (atorvastatin), risks associated with memory and physical testing, or loss of confidentiality; however every effort will be made to minimize these risks. There may also be benefits to taking the study drug (atorvastatin). Possible benefits may include a role in preventing the development of dementia, disability or cardiovascular events.

If you are interested in learning more about this study, please continue reading below.

PART 1: MAIN CONSENT FOR ALL SITES

You are being asked to participate in PREVENTABLE (PRagmatic EValuation of evENTs And Benefits of Lipid-lowering in oldEr adults), a study in about 20,000 participants from many sites across the United States. Part 1 has information about the main study and Part 2 has information about your study site. Your participation is voluntary. Please consider the following information in making your decision.

INTRODUCTION

Why am I being asked to take part in this study?

You are being asked to take part in this study because you are 75 years or older. In addition, you do not have dementia, a significant disability that limits your basic everyday activities, or heart disease.

Why is this study being done?

Statins are used to lower the level of bad cholesterol (LDL-C) in the body. They prevent heart attacks, strokes, and slow the progression of heart disease in those at high risk or who have already had these problems. The possible benefits of taking a statin for people 75 years or older who don't have heart disease are not fully understood. The purpose of PREVENTABLE is to learn if taking a statin could help older adults live well for longer by preventing dementia, disability, or heart disease.

NCT04262206

VOLUNTARY PARTICIPATION/ POTENTIAL BENEFITS

Can I say no if I don't want to participate?

Yes, you do not have to take part. You can continue to get your usual health care even if you are not in this study.

Will there be any benefit to others or me?

We do not know if you will benefit from taking part in this study. The study drug (atorvastatin) may have a role in preventing the development of dementia or cardiovascular events. You may want to participate to help doctors learn how best to care for older adults. The information learned from this study may benefit others like you in the future.

WHAT YOU CAN EXPECT IF YOU DECIDE TO PARTICIPATE

How long will I be in this study?

We would like you to take part until the study is done. We think the study will be over in 2025 or 2026. This is about five (5) years from when the first participant started in the study.

What is involved in this study?

A member of the study team will tell you about the study, ask a few questions, draw blood, and do a few memory and physical tests. You may also have a blood draw visit at three (3) months. For most of the study, we can follow you without seeing you in person. We will call you or your trusted contact each year to see how you are doing and ask questions about your memory and physical activities. If we need to follow-up on your memory and physical ability, you may have an in-person visit. In addition, we will look at your medical record and other health care sources to get information about your health.

If you decide to participate and you are a good fit for the study, the information below describes what will happen during the study.

STUDY VISIT 1

This visit will take place at your doctor's office or other convenient location and include a follow up phone call. The purpose of this visit is to confirm your interest in participating, and tell you about the study and how we will follow you.

We will also:

- Ask you to provide identifying personal information such as home address, email, phone number, Social Security number, Medicare Beneficiary Identifier, and a trusted contact (family or friend) who can answer questions about your health.
- Draw a blood sample.
- Ask questions and test your memory and physical function abilities.

Consent to Participate in a Research Study

Version 4, August 25, 2022
NCT04262206

Personal Information

We will ask you to provide the following information:

- Your date of birth so we can confirm your age.
- Your home address so we can ship study drug to you.
- Your phone number, email address, and cell phone so we can contact you each year to see how you are doing.
- Access to medical records so we can review your medical history and previous lab results.
- Contact information for your trusted contacts (family member or friend). If we can't reach you, or we need some additional information about your health, we will contact them. You may choose to give us the name of your doctor or health care provider as your trusted contact.
- Your Social Security number and Medicare Beneficiary Identifier so we may follow you by having access to your health data through sources such as Medicare data, other insurance sources, or the National Death Index.

Blood Sample Collection

We will ask you to give a blood sample. We will use a needle to draw about four (4) teaspoons of blood from your arm. A portion of this blood will be used to measure your cholesterol. You will not be told your cholesterol results. A portion of this blood will be saved for later for genetic and other lab testing.

Physical Function Tests

We will ask you to do tasks that test your physical abilities, like walking and balance. For example, we will ask you to walk a short distance without help and stand up from a chair without using your arms.

Memory Tests

We will ask you to complete tests about your memory and thinking abilities. The memory tests are done by telephone following your visit in your doctor's office.

Study Drug Assignment

You will be randomly assigned to either: 1) a statin called atorvastatin or 2) a placebo. Randomly assigned means your group assignment will be determined by chance. You will have an equal chance of receiving the study drug or the placebo. Neither you, your study doctor, nor the staff at the study site will know to which group you have been assigned.

Atorvastatin is a generic drug approved by the FDA. It is used to treat high cholesterol. A placebo is a pill that does not have any medicine in it and looks exactly like the study drug. Researchers use placebo pills so they can find out if the study drug affects a participant's health. After the first visit, you will be asked to take one (1) study drug tablet a day until the study is done.

We will ship study drug directly to your home every three months. It is important to let the study team know if your address changes while you are participating so the study drug arrives on schedule.

NCT04262206

FOLLOW UP

Phone Calls

After your first visit, we will call you once a year until the study is complete to monitor your memory, physical ability, daily activities, and mood. We will also ask if you are still taking your study drug. This call will take about 30 minutes.

We will also contact the person you listed as your trusted contact if we cannot reach you or if we need some additional information about your health. We will ask them some questions about your memory, daily activities, and mood. We will not share your health information with this person.

In-Person Visits

We may contact a small number of participants each year to schedule additional testing in person if the phone call does not provide enough information to know how you are doing. We will work with you to schedule a time for a healthcare professional to perform this testing in your home, clinic, or another convenient location. It will take about 1 hour (60 minutes), but may last as long as 1.5 hours (90 minutes).

Audio Recordings

We will record the phone calls and in-person testing. We do this to make sure the memory tests are given the same way to everyone. You may request that you not be recorded. You will not be able to inspect, review, or approve the recordings. These recordings will be kept confidential and will be identified only by study number.

3-Month Visit

We may ask you to return to the study site for a follow-up blood draw to retest the cholesterol levels three (3) months after your baseline visit. This will be performed with a small group of participants, so it is possible you may not return for this follow-up test. You will not be told your cholesterol results.

Can I Stop Participating before the Study is Complete?

You can stop participating in this study at any time. If possible, we would like you to stay in the study until it is complete because your information is helpful. If you are thinking about stopping, please let your study doctor know as soon as possible. Your study doctor can talk about options that might work for you to continue.

We will tell you if we learn anything new that might change your mind about being in the study. If you decide to stop participating, your usual medical care will not be affected.

Unless you tell us to stop, we will call you or your trusted contact each year of the study, and access your medical record and Medicare data. If you decide to stop taking the study calls or if we lose contact with you, we will follow you by using your medical record, Medicare data and your trusted contact to see how you are doing until the study is done.

NCT04262206

HOW WILL MY CONFIDENTIALITY BE PROTECTED?

In all research, there is a possible risk of the loss of confidentiality but we will do our best to keep your data secure.

This study will have a *Certificate of Confidentiality* issued by the National Institutes of Health (NIH). This certificate is to protect the identity of research participants. It means that doctors, researchers, and other staff involved in this study cannot be forced to provide identities of any participants in any legal proceeding.

We will keep your personal information separate from other study information. To do this, we assign a unique code to identify your study information so that no one will know who you are from the data. This process keeps your health information and study results separate from your other personal information. The file that links your identity to the code number will be kept securely at the study site and can be accessed only by approved study team members.

Sharing and Receiving Information with and from Your Health Insurance Plan

We will share and receive certain health information with and from your health insurance plan and medical record while you are in the study. Receiving your medical, pharmacy, laboratory records, and claims information will help us understand your health while you are participating in the PREVENTABLE study.

Information we will share with your health insurance plan or health care provider

We will share information with your health insurance plan or health care provider including your Social Security number, Medicare Beneficiary Identifier, date of birth, and sex. They will use this information to properly identify you so they can provide us the information about how you are doing based on health records.

Information we will receive from your health insurance plan or medical record

The information we receive from your health insurance plan might include any heart attacks or strokes you had. It may include information on your mental status or disability. In addition, we will receive the number of office, hospital, or emergency room visits you made. We may also collect information about medicines, lab results, and other information that we determine may be useful to the study. Your personal information will be removed and replaced with a unique code before it is sent to us. This step is done to protect your confidentiality.

ALTERNATIVES

What other choices are there?

Your other choice is not to participate. Your usual medical care will continue whether or not you participate in this study.

Version 4, August 25, 2022
NCT04262206

RESULTS AND STUDY PROGRESS

Will I be told the results of the research?

You should not expect to receive personal health information including the results of your blood cholesterol from this research. Research is not the same as medical care. If you give permission we may share some information about your health with your doctor or with you if important for your well-being.

We may contact you with notes, newsletters, or other updates related to the study. We will summarize what we learned when the final study results become available. We will share the summary of results on the study website: preventabletrial.org.

A description of this study will also be available on clinicaltrials.gov as required by U.S. law. You can search these websites at any time.

None of these website locations will contain any information specific to you. At most, the website will include a summary of the results. The articles published about the study will not include any information specific to you either.

POSSIBLE RISKS AND DISCOMFORTS

A team of health experts called the Data and Safety Monitoring Board chosen by the National Institute on Aging will regularly monitor the safety of study participants and the progress of the study overall.

What risks can I expect from taking part in this study?

Possible side effects associated with taking atorvastatin are described below.

SIDE EFFECTS ASSOCIATED WITH TAKING ATORVASTATIN

The most common (~1 in 20 people) include:

- Nausea or diarrhea
- Muscle pain also called myalgia

Rarely occurring (~1 in 1,000 people) include:

- Muscle weakness, tenderness, pain or rupture also called myositis. If at the same time, you feel unwell or have a high temperature this may cause an abnormal muscle breakdown. The abnormal muscle breakdown usually reverses when stopping atorvastatin, but can be life threatening and lead to kidney problems.

Very rarely occurring (~1 in 10,000 people) include:

- Liver injury, elevation of liver enzymes, or jaundice (yellowing of the skin). Although usually reversed when stopping atorvastatin, this could be life threatening.
- Increases in blood sugar levels (If you have diabetes, continue monitoring of your blood sugar levels.)

RISKS ASSOCIATED WITH DRAWING BLOOD

The risks of blood drawing include bleeding at the puncture site, bruising and pain. Bleeding and bruising occur in a very small portion of the population. A very short period of pain from the needle

Consent to Participate in a Research Study

Version 4, August 25, 2022
NCT04262206

stick occurs in most people. Some people become dizzy, lightheaded, or feel faint. Infection may occur on rare occasions.

RISKS ASSOCIATED WITH MEMORY AND PHYSICAL TESTING

Testing may cause some people to get frustrated or tired. There is a risk of losing your balance and falling during the physical testing. We will decrease this risk by being at your side if you need help.

FUTURE CONTACT

We may contact you to ask if you are interested in participating in additional visits related to PREVENTABLE. This will be voluntary. These calls and visits are not included in this consent. You will be asked to sign a separate consent form. If you agree, you will be told what additional calls or visits would be involved.

FUTURE RESEARCH STUDIES

We may contact you in the future to ask if you are willing to participate in additional studies. This will be voluntary. If you agree, you will be informed of the study and what is involved. You will be asked to sign a new consent form.

RESEARCH USE OF SAMPLES

Who can use my samples and what types of research will be done with my samples?

Some of your blood will be sent to ICON laboratories to test your cholesterol level. The remaining blood will be sent to a laboratory at the Mayo Clinic to be stored for use in future research. Some of this future research may include genetic testing. The study of genetics is important because it helps scientists identify and understand diseases. By gaining a deeper understanding of the body, scientists can determine how likely members of the population are to inherit a disease and help people manage their risks accordingly.

One risk of giving samples for this research may be the release of your name that could link you to the stored samples and/or the results of the tests run on your samples. Before we send your blood samples to the lab, we will remove your personal information, like your name and replace it with a unique code. Only the study staff will know the code. The name that belongs to the code will be kept in a locked file or in a computer with a password.

There is a federal law in the United States called, The Genetic Information Nondiscrimination Act (GINA) that prevents employers and health insurers from asking for or using the genetic information to make decisions about your employment or health care coverage. GINA does not protect against genetic discrimination by companies that sell life insurance, disability insurance, or long-term care insurance. GINA also does not protect you against discrimination based on an already-diagnosed genetic condition or disease.

Your sample will be used to make DNA that will be kept for an unknown length of time (maybe years) for future research. The sample will be destroyed when it is no longer needed.

At the end of the study, all remaining blood samples, along with the data generated from your DNA, may be moved to a blood bank at the NIH. These samples will not include information that personally

Consent to Participate in a Research Study

Version 4, August 25, 2022
NCT04262206

identifies you. They will be labeled with a unique code. The NIH may make your samples available to other researchers for future research without obtaining additional consent from you.

Will I be paid for any future use?

No, you will not be paid for any future use of your samples or data.

How long will my data/samples be stored for future use?

Your data will be stored indefinitely. Your blood sample will be kept until the sample is used up.

Will I get any results back from future research use of my data or samples?

You should not expect to receive any results from any future research that may use your data. We may share this information with other researchers for their research. This sharing of information will happen without obtaining any additional approval from you. All future research studies will be approved by an independent scientific committee or ethics board. We will remove any information that may personally identify you from anything that is shared in the future.

What if I change my mind about future use of my samples?

If you decide that you do not want us to use or share your samples, you can contact your study doctor to request destruction of the remaining samples. Please see contact information at the end of this consent form. You will be notified of compliance with such a request and supporting materials will be maintained for tracking. If we do not have the information that is needed to link your data or samples back to you, we will not be able to locate the data or samples in order to remove them. If the data is necessary to preserve the study results for regulatory purposes, we will not be able to remove your data until the regulatory purposes are complete. We will also not be able to recall any information or samples that have already been used or shared.

Allowing Use of Your Genetic Sample for Research

Do you agree to allow your genetic sample labeled with a unique code to be used for future research?

Please review the question below and place your initials in the space that goes with your answer. You can still participate in this study even if you answer NO.

YES _____

NO _____

Allowing Report of Cognitive (Memory /Thinking) Changes to Your Doctor

Do you agree to allow your test results to be reported to your doctor if there is a concerning change either to your cognitive function or your mood?

Please review the question below and place your initials in the space that goes with your answer. You can still participate in this study even if you answer NO.

YES _____

NO _____
